

BUSINESS PLAN

PROJET NEAUMADE

VICTOR DANSET
AYMERIC ROY
LEO POUILLY

Project Summary

The world is facing a major challenge: access to drinking water. In 2022, approximately 700 million people did not have access to safe drinking water, particularly in North Africa and the Middle East.

NeauMade offers an innovative solution: an atmospheric water generator that extracts moisture from the air and converts it into drinking water. This device operates independently of traditional water supply infrastructures and is environmentally friendly.

The target market is primarily focused on rural and isolated areas in developing countries, especially in sub-Saharan Africa, where 408 million people lack access to safe drinking water.

The Democratic Republic of Congo is an example of a strategic market, with an average humidity rate of 80% and poor-quality water resources.

The project is carried by a team of three individuals:

- Victor Danset, engineering student and project lead
- Léo Pouilly, engineering student
- Aymeric Roy, business/entrepreneurship student

Key activities of the project include R&D to refine the technology, prototype manufacturing, supplier sourcing, production, marketing and distribution, as well as after-sales service to ensure product durability. Strategic partnerships with NGOs and governments are also essential to expand the product's reach.

The financial objectives for the first year are a turnover of €56,000 through the sale of 70 generators. Expected growth for the second year is 20%, with an estimated turnover of €67,200. In the long term, the goal is to become a key player in the global market for water access solutions, with continuous annual growth of 25% over 3 to 5 years.

The funding requirements for the first three years are estimated at €100,000, intended to finance R&D, production, marketing, and logistical support. Initial funding of €20,000 will be sought through private investors, crowdfunding, or grants to develop the first prototypes and begin commercialization.

The chosen legal structure is a SASU (Single-Member Simplified Joint Stock Company), offering limited liability and high management flexibility, ideal for a high-growth project. This status is also suitable for attracting investors and facilitating fundraising, which is crucial for the development and growth of the project

L'équipe

General Presentation of the Project

NeauMade is an innovative project that addresses the urgent issue of access to safe drinking water in regions of the world facing chronic water shortages.

In 2022, approximately 408 million people in sub-Saharan Africa, or 1 in 3, did not have access to safe drinking water, according to the WHO.

More specifically, in the Democratic Republic of Congo, with an average humidity rate of 80%, 33 million people do not have access to running water, and when they do, it is often of poor quality.

The NeauMade project aims to harness the moisture present in ambient air to produce drinking water using advanced condensation technology. The operating principle is simple: ambient air is drawn in by a fan and then cooled using a thermal system, allowing water vapor to condense into droplets. The collected water is then filtered and purified before being stored in a tank for domestic use or emergency situations.

NeauMade was born from the team's desire to provide a sustainable, autonomous, and environmentally friendly solution to the global water crisis.

This idea emerged from the realization that, despite high humidity in regions like the Congo, local populations often do not have access to safe drinking water due to the lack of infrastructure and the poor quality of available water.

The economic part of the Business Plan

- **Product life cycle :**

- **Manufacturing:** After the launch, the generators will be produced in series. The manufacturing process involves assembling the electronic components, mounting the condensation and purification system, as well as integrating the solar panels. This part will be carried out by NeauMade.
- **Usage:** The generator is designed for autonomous use at home or in rural areas. It requires minimal maintenance, except for the periodic replacement of filters and cleaning of components.
- **End of life:** The recycling of components will be managed by the appropriate services.

● Business Model Canva :

● Conclusion of the Market Study

The market for atmospheric water generators is experiencing steady growth, mainly due to the increasing shortage of drinking water in many regions around the world, particularly in Sub-Saharan Africa. In 2024, the atmospheric water generator market was valued at \$2.8 billion, with an average annual growth rate of 8%, and is expected to reach \$4.55 billion by 2030 (according to Grand View Research).

In Sub-Saharan Africa, about 408 million people lack access to safe drinking water, representing nearly 1 in 3 of the population. Conditions are particularly difficult in countries such as the Congo, where the average humidity rate is 80%, yet 33 million people still have no access to drinking water — and even when available, it is often of poor quality.

This context creates a huge demand for alternative and sustainable solutions, such as atmospheric water generators, which can harness moisture from the air to produce potable water.

Atmospheric water generators are already in operation in remote and rural areas, and initiatives such as Majik Water in Kenya, which produces around 200,000 litres of water per month, clearly demonstrate the effectiveness of this technology. These figures (reported by *Le Monde*) show not only that the technology is viable, but also that it can have a significant impact on the communities that benefit from it.

Moreover, according to a ReportPrime report, the atmospheric water generator market is experiencing rapid growth (8% annually) due to the rising environmental awareness and increasing demand for sustainable solutions. This offers a strategic opportunity for the NeauMade project.

Thus, with the rapid growth of the market and the pressing demand for ecological and autonomous solutions, NeauMade is well positioned to meet the increasing needs for access to drinking water, particularly in Sub-Saharan Africa.

The long-term ambition of the project is to revolutionize access to water in regions where supply infrastructures are limited, especially in Sub-Saharan Africa.

● Positioning

NeauMade's positioning aims above all to be accessible. In addition, the atmospheric water generator will be perceived as an innovative and sustainable solution adapted to the needs of the populations of Sub-Saharan Africa.

NeauMade targets a variety of customer segments depending on the specific needs for drinking water in different contexts.

→ Individuals

- ◆ Description: Private consumers, especially those living in rural or isolated areas. This segment also includes environmentally conscious individuals seeking to reduce their dependence on traditional water networks or bottled water purchases.
- ◆ Needs: A simple, affordable, and sustainable solution that ensures constant access to drinking water.
- ◆ Value proposition: Reduce users' water purchase costs and carbon footprint.

→ Humanitarian Organizations

- ◆ Description: NGOs and humanitarian organizations operating in areas affected by crises, natural disasters, or regions suffering from chronic water shortages.
- ◆ Needs: Provide drinking water in emergency situations or in areas with limited access to water. Humanitarian organizations need efficient and rapidly deployable solutions.
- ◆ Value proposition: A system capable of reliably producing drinking water without requiring large infrastructures, which is particularly useful in remote or hard-to-reach areas.

→ Agricultural Sector :

- ◆ Description: Small farms in dry or semi-arid regions face water supply challenges for irrigation and workers' needs. The agricultural sector is particularly sensitive to climatic variations and seeks alternative solutions to ensure a constant water supply.

- ◆ Needs: Access to a regular and reliable water source for small-scale crop irrigation and agricultural use.
- ◆ Value proposition: Production of water for irrigation, suitable for small farms. The atmospheric water generator can complement existing irrigation systems and help maintain stable production.

→ **Government and Local Authorities**

- ◆ Description: Governments and local authorities seeking to improve public services by providing reliable access to drinking water. This is particularly relevant for rural and remote areas.
- ◆ Needs: Provide autonomous and reliable access to drinking water in remote or hard-to-reach regions without massive investments in costly infrastructure..

→ **Businesses**

- ◆ Description: Companies, particularly those in the restaurant and tourism sectors, are increasingly aware of the impact of their brand image regarding sustainability. These companies may be interested in purchase or rental solutions to enhance their environmental image.
- ◆ Needs: Implement environmentally friendly water supply solutions at their sites and promote a public commitment to sustainability.

Segmentation du marché NeauMade

Marketin Mix

- **Product**

The product is designed to be autonomous and capable of producing 20 liters of water per day. The generator is equipped with a condensation and filtration system to ensure the quality of the water produced.

=> Features: Autonomous, eco-friendly product, independent from existing water supply infrastructures.

=> Life cycle: The product can be used for an extended period with minimal maintenance (filter replacement and regular cleaning).

- **Prix**

The unit price of the generator is set at €800 for a daily production of 20 liters of water. This pricing strategy aims to be affordable while ensuring a sufficient profit margin to cover production, R&D, and distribution costs.

- Pricing strategy: Considering production costs and the increasing demand for sustainable water solutions, the €800 price point is highly competitive (around €2,000 for similar products).
- Year 1 objective: Generate €56,000 in revenue, representing the sale of 70 units

● **Place**

→ Distribution Channel :

- ◆ Direct sales: Dedicated website for purchase and delivery.
- ◆ Rental service: Additional revenue stream for temporary use (e.g., events).
- ◆ Partnerships with NGOs: To facilitate product deployment in high-demand areas (rural regions, crisis zones).
- ◆ Professional trade shows: Represent the brand at events (e.g., technology fairs, Lépine competition) to generate sales or rentals among businesses and individuals.

→ Distribution Model :

- ◆ Individual customers: Home delivery at the customer's expense.
- ◆ Selective distribution for NGOs and associations: Due to the product's specificity and target market (rural areas, humanitarian organizations), distribution will rely on specialized resellers and distributors of ecological products.
- ◆ Indirect channels: Sales through NGOs and government programs.

● **Promotion**

- Online advertising: Use of social media, paid search campaigns, and display advertising to reach individuals and organizations interested in sustainable water access solutions. Creation of TikTok, Facebook, and Instagram accounts to generate viral, organic content.
- Community outreach: Collaboration with NGOs, institutions, and local governments to promote the product in sensitive areas.

- Trade shows and events: Participation in exhibitions focused on sustainable development, renewable energy, and technology to increase brand visibility.
- Influencer partnerships: Use of ambassadors or influential partners to promote NeauMade's mission.

Sales Forecast

For NeauMade, the first-year sales forecast is estimated at €56,000, corresponding to the sale of 70 atmospheric water generators at €800 each. This projection is based on a gradual market penetration strategy focused primarily on rural and remote areas in Sub-Saharan Africa, where access to clean water is a major challenge. The estimate accounts for potential demand in the targeted regions.

First-year objectives:

- Projected revenue: €56,000
- Sales volume: 70 generators at €800 each
- Main targets: Tech-curious individuals and NGO partnerships to reach rural and isolated areas in Sub-Saharan Africa

Mid-term growth projections:

- Year 2: With a 20% increase in sales, NeauMade aims to sell 84 generators, achieving €67,200 in revenue. A rental service will also be implemented.
- Year 3: Expansion of sales with a goal of at least 100 generators sold, increasing revenue to approximately €80,000 or more. The rental service could generate an additional €10,000.

When compared with the competing company Kumulus, which recorded a turnover slightly below €700,000 in 2022 (founded in 2020) with moderate balance sheet results, NeauMade's projected growth path appears very cautious. It would not be surprising to exceed these figures.

Main activities of the project :

- **Research and Development (R&D):** Improve the atmospheric water extraction technology, particularly by enhancing energy efficiency and production capacity.
- **Prototype manufacturing:** Verify the proper functioning of the technology and identify areas for improvement and optimization.
- **Supplier sourcing:** Find suppliers offering competitive prices.
- **Production and manufacturing:** Launch the production of the first commercial-scale atmospheric water generators. This involves managing supply chains, establishing partnerships with manufacturers, and ensuring quality control.
- **Marketing and distribution:** Develop campaigns to promote the product, raise awareness about the importance of access to water, and manage distribution channels.
- **After-sales service, maintenance, and rental:** Set up a maintenance service to ensure the proper functioning of the atmospheric water generators and guarantee their long-term durability. Simultaneously, launch a rental service.
- **Strategic partnerships:** Collaborate with NGOs, governments, and international organizations to deploy the technology in high-demand areas.

SWOT :

Strengths : - Innovative technology - Autonomous solution ideal for isolated areas - Reduced dependence on traditional infrastructures - Strong potential for social and environmental impact	Weaknesses : - High initial production costs - Need for public education to encourage product adoption - Variation in climatic conditions may lead to inconsistent production
Opportunities : - Strong demand for alternative water production solutions - Market growth - Few competitors in the market - Increased awareness of the importance of water consumption - Possibility of partnerships with NGOs and governments	Threats : - Growing competition for similar solutions - Strong existing players in the market - Dependence on suppliers - Strict regulations on water quality - Cultural and regulatory barriers in certain regions

The Financial Section of the Business Plan

The production cost for each atmospheric water generator is broken down as follows:

Main Components	Costs
Air filter	3,41 €
Heat Exchanger	48,69 €
Collection tray	15,00 €
Compressor	50,00 €
Water filters	50,63 €
UV treatment	20,00 €

Ozone system	20,00 €
Electronics assembly	30,00 €
Aluminium (5754)	130,00 €
Plastic wheels	10,00 €
Plastic casting	30,00 €
Contingency margin	100,00 €
Total	507,73 €

The total production cost for each atmospheric water generator is therefore €507.73. This cost includes all components necessary for manufacturing the generator, including the structure, electronics, filters, and water treatment management.

Sales price and margin

The sales price of a generator is set at €800, which allows a gross margin of 36.5%, calculated as follows:

- Sales price: €800
- Production cost: €507.73
- Gross margin = 36.5%

First year:

- Sales: 70 generators
- Projected revenue: €56,000
- Total production cost: €35,541.10
- Gross margin: €20,458.90
- Approximate gross margin: 36.5%

Second year:

With a growth target of 20% compared to the first year, the estimated sales for the second year are 84 generators.

- Projected revenue: €67,200
Total production cost: €42,620.52

Third year:

Continuing this 20% growth trend:

- Projected revenue: €80,000
Total production cost: €50,773
- Gross margin: €29,227

It should be noted that from the second year, a 10% discount could be considered on the main components used in the manufacture of the generators. This discount is mainly due to the arrival of more competitive suppliers, enabled by NeauMade's growing reputation.

These negotiations with suppliers will reduce production costs by approximately 10.5%, resulting in savings of €3,715.90 for the production of 70 generators.

As a result, the gross margin will increase from 36.5% to 43.2%, thereby improving the company's profitability and offering greater flexibility for future expansion while maintaining competitive prices. These discounts will be particularly beneficial as production increases and the company aims for continuous growth in the coming years.

Legal Section of the Business Plan

Legal structure chosen: SASU

For NeauMade, the chosen legal status is that of a Société par Actions Simplifiée Unipersonnelle (SASU). This choice is motivated by several strategic and operational reasons that align with the project's needs and ambitions:

- Limited liability: By opting for a SASU, the entrepreneur benefits from limited liability up to the amount of the share capital, thus protecting personal assets. This structure provides a secure legal framework for an innovative project like NeauMade, which carries financial risks related to product launch and development.

- Flexibility in management: The SASU allows great flexibility in managing the company. The entrepreneur alone makes strategic decisions, which simplifies administrative procedures and optimizes responsiveness to market changes. This allows NeauMade to remain agile in its development while benefiting from a clear and coherent structure to attract external partners.
- .
- Possibility of transformation: A SASU can easily be converted into a Société par Actions Simplifiée (SAS) if the structure evolves, particularly if new shareholders join the company. This provides great flexibility for the future, especially in the case of external investments or capital increases.
- Favorable taxation: The SASU allows the entrepreneur to choose the tax regime: either corporate tax (IS) or income tax (IR), thus enabling tax optimization based on the profits generated. This allows NeauMade to adapt to its profitability while optimizing its tax burden.

The governance model will be centralized, with direct control by the founder, but it could evolve if the company grows and requires the addition of a board of directors or new shareholders to meet strategic needs.
